A hydroxy or hydroxyl group is the entity with the formula OH. It contains oxygen bonded to hydrogen. In organic chemistry, alcohol and carboxylic acids contain hydroxy groups. The anion [OH⁻], called hydroxide, consists of a hydroxy group. According to IUPAC rules, the term hydroxyl refers to the radical OH only, while the functional group ⁻OH is called hydroxy group.

Functionalization and dispersion of graphene sheets are of crucial importance for their end applications. Chemical functionalization of graphene enables this material to be processed by solvent-assisted techniques, such as layer-by-layer assembly, spin-coating, and filtration.

Chemical functionalization of graphene and its

Harnessing the exceptional physical properties of graphene often requires its dispersion into aqueous or organic media. Dispersion must be achieved at a concentration and stability appropriate to the final application.

Right panel: a strand of linked DNA nucleotides. The sugars are connected by phosphodiester bonds. A phosphodiester bond consists of a phosphate group in which two of the oxygen atoms are bonded to other atoms - in this case, to carbon atoms of the neighboring deoxyribose sugars.
