ECL was invented in August 1956 at IBM by Hannon S. Yourke. Originally called current-steering logic, it was used in the Stretch, IBM 7090, and IBM 7094 computers. The logic was also called a current-mode circuit. It was also used to make the ASLT circuits in the IBM 360/91.. Yourke's current switch was a differential amplifier whose input logic levels were different from the output logic levels.
